

Custom Cut-To-Length Aluminum Tubing and Shapes

Dayco Industries stocks and distributes aluminum tubing and other aluminum shapes/extrusions to O.E.M. manufacturers in the Western United States. This affords Dayco the ability to utilize the volume buying of product in the making of Custom Cut-To-Length aluminum products for clients who do not have the same ability, as do larger manufacturing firms. In tubular, architectural or custom shapes and solids Dayco can cut it.

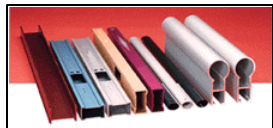

Utilizing a Two-Plane tube Straighter, Dayco can also produce cut straight lengths off of coil. Outside diameter ranging from 1/8" to 7/8" and lengths from 1 inch through 25 feet. The burr-less (Crown) cutting of these lengths gives the tube ends the look as though they were cut with a tube cutter, eliminating the risk of hanging burrs or chips created by traditional blade cutting techniques.

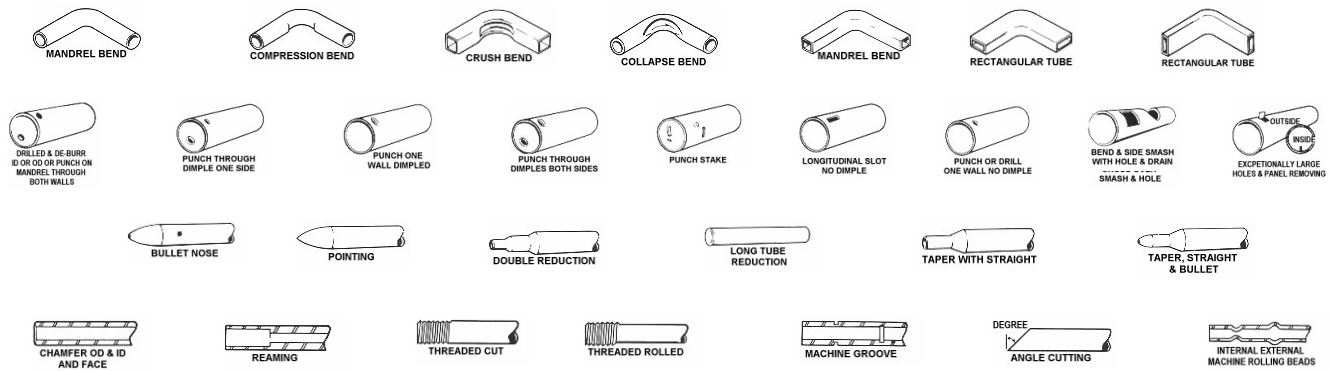

For tube sizes greater than 7/8" and up to 4" plus architectural and custom shapes and solids Dayco operates a high-volume CNC programmable cutting saw which utilizes an automated loading table and the ability to

program 24 discrete lengths per raw part.

Additional processing which may be required for the cut-to-length product is available and aids the manufacturer who can utilize an Dayco Just-In-Time (JIT) stocking program. Below one can find a sampling of fabrication processes performed for our clients. Dayco also provides painting and anodizing services to make for a complete product, ready for release and shipment.

Custom packing and labeling to meet inventory control requirements are available. In-process controls monitor product as-it's produced. Certification of compliance and material test reports are available upon prior agreement
